ABSTRACT

5 Effective amounts of formoterol (and/or a physiologically acceptable salt and/or a solvate thereof) and budesonide are used in combination for simultaneous, sequential or separate administration by inhalation in the treatment of respiratory disorder.

23940-804 (D)

1

New combination of formoterol and budesonide.

This application is a division of Canadian application 2,123,909, which entered the Canadian National Phase on May 18, 1994 and which stemmed from PCT application 5 PCT/EP92/02826 filed on December 7, 1992.

Field of the invention

This invention relates to improvements in the treatment of mild as well as severe asthma and other respiratory disorders. More particularly, it relates to the 10 use of a bronchodilator in combination with a steroid anti-inflammatory drug for the treatment of respiratory disorders such as asthma, and to pharmaceutical compositions containing the two active ingredients. It emphasizes the use of a long-acting bronchodilator which provides rapid relief of symptoms.

15 **Background of the invention**

There have recently been significant advances in our understanding of asthma. Despite many advances, both in awareness of the disease by doctors and patients alike, coupled with the introduction of very powerful and effective anti-20 asthma drugs, asthma remains a poorly understood and often poorly treated disease. Previously, contraction of airway smooth muscles has been regarded as the most important feature of asthma. Recently there has been a marked change in the way asthma is managed, stemming from the fact that asthma is 25 recognized as a chronic inflammatory disease. Uncontrolled airway inflammation may lead to mucosal damage and structural changes giving irreversible narrowing of the airways and fibrosis of the lung tissue. Therapy should therefore be aimed at controlling symptoms so that normal life is possible and at 30 the same time provide basis for treating the underlying inflammation.

23940-804 (D)

The most common cause for poor control of asthma is poor compliance with the long-term management of chronic asthma, particularly with prophylactic treatments, such as inhaled steroids, which do not give immediate symptom relief.

5 Patients will readily take β_2 -agonist inhalers, since these provide rapid relief of symptoms, but often do not take prophylactic therapy, such as inhaled steroids, regularly because there is no immediate symptomatic benefit. They also counteract down regulation of β_2 -adrenoceptor agonists.

10 Formoterol, (N-[2-hydroxy-5-[1-hydroxy-2-[(2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide), is an adrenoceptor agonist which selectively stimulates β_2 -receptors, thus producing relaxation of bronchial smooth muscle, inhibition of the release of endogenous spasmogens, 15 inhibition of oedema caused by endogenous mediators, and increased mucociliary clearance. Inhaled formoterol fumarate acts rapidly, usually within minutes which gives the patient immediate confirmation that he has taken an adequate dose and thereby avoiding overdosing of both β_2 -agonist and steroid.

20 Inhaled formoterol also exerts a prolonged bronchodilation, which in clinical trials has been demonstrated as up to 12 hours.

Budesonide, (16,17-butyldenebis(oxy)-11,21-dihydroxypregna-1,4-diene-3,20-dione), may be given in a high 25 inhaled dose (up to 2 mg daily) with very low systemic effects, possibly because of its rapid metabolism. The high rapid systemic elimination of budesonide is due to extensive and rapid hepatic metabolism. Long term clinical studies have shown that inhaled budesonide is a pharmacologically safe drug.

30 High doses of inhaled budesonide are highly effective and well tolerated when used in oral steroid replacement therapy.

23940-804 (D)

Budesonide represents a logical safe and effective therapy for long term control of asthma.

The inhaled route of administration enables the dose to be delivered directly to the airways. By this type of 5 administration, it is possible to give a small dose and thereby minimizing unwanted side-effects. The drawbacks of the currently available bronchodilators are their relatively short duration of action. By using a compound with long duration e.g. formoterol it would be possible to avoid the nocturnal 10 asthma, which so often causes considerable anxiety and debility to the patients. Formoterol gives less nocturnal waking than the commonly used short-acting agonists like salbutamol, terbutaline and the like. Formoterol has been registered for oral administration in Japan since 1986.

15 Pharmaceutical combinations of long-acting β_2 -agonists and steroids are disclosed in two European applications, EP 416950 which discloses the combination of salmeterol and beclomethasone, and EP 416951 which discloses the combination of salmeterol and fluticasone propionate.

20 In Ann. Allergy 1989, 63 (3), p. 220-224 the use of a β_2 -agonist, i.e. formoterol and a steroid, i.e. budesonide separately are mentioned. It is not disclosed a pharmaceutical combination including both formoterol and budesonide, or the use of the two compounds in combination therapy. The use of a 25 β_2 -agonist and a steroid separately is also mentioned in Lung (1990), 168, no. supp, p. 105-110.

Outline of the Invention

The present invention is based on the concept of a novel combination therapy whereby formoterol (and/or a 30 physiologically acceptable salt and/or solvate thereof) and budesonide are administered simultaneously, sequentially or

23940-804 (D)

separately by inhalation. This combination has not only a greater efficiency and duration of bronchodilator action but the combination also has a rapid onset of action. This new feature is of utmost importance in order to establish a higher 5 compliance for patients and it provides a rescue medicine thereby avoiding the necessity for the patient of carrying two different inhalers. This simplifies life for patients considerably and makes life more comfortable and secure. The rapid onset of the long-acting β_2 -agonist gives the patient 10 immediate confirmation that he has taken an adequate dose and thereby avoiding overdosing of both β_2 -agonist and steroid. Since the use of formoterol instead of salmeterol gives a much more rapid onset, the combinations according to the invention have a number of advantages compared to the combinations 15 disclosed in EP 416950 and EP 416951. The combination according to present invention permits a twice daily dosing regime as a basic treatment of asthma, particularly nocturnal asthma.

The present invention provides a medicament 20 containing, separately, or together, (i) formoterol (and/or a physiologically acceptable salt and/or solvate thereof) and (ii) budesonide for simultaneous, sequential or separate administration by inhalation in the treatment of respiratory disorder.

25 The invention also provides a pharmaceutical composition for administration by inhalation in the treatment of respiratory disorder which composition comprises formoterol (and/or a physiologically acceptable salt and/or solvate thereof) and budesonide.

30 According to another aspect of the invention there are provided pharmaceutical compositions comprising effective amounts of formoterol (and/or a physiologically acceptable salt

23940-804 (D)

and/or solvate thereof) and budesonide as a combined preparation for simultaneous, sequential or separate administration by inhalation in the treatment of respiratory disorder.

5 The invention further provides formoterol (and/or a physiologically acceptable salt and/or solvate thereof) and budesonide for use in combination therapy by simultaneous, sequential or separate administration by inhalation in the treatment of respiratory disorder.

10 Further the invention provides the use of formoterol (and/or a physiologically acceptable salt and/or solvate thereof) in the manufacture of a medicament for combination therapy where formoterol (and/or a physiologically acceptable salt and/or solvate thereof) and budesonide are administered
15 simultaneously, sequentially or separately by inhalation in the treatment of respiratory disorder and the use of budesonide in the manufacture of a medicament for combination therapy where formoterol (and/or a physiologically acceptable salt and/or solvate thereof) and budesonide are administered
20 simultaneously, sequentially or separately by inhalation in the treatment of respiratory disorder.

The invention additionally relates to the use of formoterol (and/or a physiologically acceptable salt and/or solvate thereof) and budesonide in the manufacture of a
25 medicament for combination therapy for simultaneous, sequential or separate administration of formoterol and budesonide by inhalation in the treatment of respiratory disorder.

According to a further feature of the invention there is provided a method of treating respiratory disorder which
30 comprises the simultaneous, sequential or separate administration by inhalation of effective amounts of formoterol

23940-804 (D)

(and/or a physiologically acceptable salt and/or solvate thereof) and budesonide.

Suitable physiologically acceptable salts of formoterol include acid addition salts derived from inorganic 5 and organic acids, such as the hydrochloride, hydrobromide, sulphate, phosphate, maleate, fumarate, tartrate, citrate, benzoate, 4-methoxybenzoate, 2- or 4-hydroxybenzoate, 4-chlorobenzoate, p-toluenesulphonate, methanesulphonate, ascorbate, salicylate, acetate succinate, lactate, glutarate, 10 gluconate, tricarballylate, hydroxynaphthalenecarboxylate or oleate. Formoterol is preferably used in the form of its fumarate salt and as a dihydrate.

The ratio of formoterol to budesonide used according to the invention is preferably within the range of 1:4 to 1:70. 15 The two drugs may be administered separately in the same ratio.

The intended dose regimen is a twice daily administration, where the suitable daily dose of formoterol is in the range of 6 to 100 µg with a preferred dose of 6-48 µg and the suitable daily dose for budesonide is 50 to 4800 µg 20 with a preferred dose of 100-1600 µg. The particular dose used will strongly depend on the patient (age, weight etc) and the severity of the disease (mild, moderate, severe asthma etc).

For administration, the combination is suitably inhaled from a nebulizer, from a pressurized metered dose 25 inhaler or as a dry powder from a dry powder inhaler (e.g. as sold under the trade mark Turbuhaler) or from a dry powder inhaler utilizing gelatine, plastic or other capsules, cartridges or blister packs.

A diluent or carrier, generally non-toxic and 30 chemically inert to the medicament e.g. lactose, dextran, mannitol or glucose or any additives that will give the

23940-804 (D)

medicament a desired taste, can be added to the powdered medicament.

Examples of the preparation of suitable dosage forms according to the invention include the following: Formoterol fumarate dihydrate and budesonide (optionally premicronized) are mixed in the proportions given above. The agglomerated, free-flowing micronized mixture may be filled into dry powder inhaler such as sold under the trade mark Turbuhaler. When a capsule system is issued, it is desirable to include a filler in the mixture.

The micronized mixture may be suspended or dissolved in a liquid propellant mixture which is kept in a container that is sealed with a metering valve and fitted into a plastic actuator. The propellants used may be chlorofluorocarbons of different chemical formulae. The most frequently used chlorofluorocarbon propellants are trichloromonofluoromethane (propellant 11), dichlorodifluoromethane (propellant 12), dichlorotetrafluoroethane (propellant 114), tetrafluoroethane (propellant 134a) and 1,1-difluoroethane (propellant 152a). Low concentrations of a surfactant such as sorbitan trioleate, lecithin, disodium dioctylsulphosuccinate or oleic acid may also be used to improve the physical stability.

The invention is further illustrated by way of example with reference to the following Examples.

25 Example 1 - Dry powder inhaler (Turbuhaler)

<u>Active ingredient</u>	<u>Per dose</u>
Formoterol (as fumarate dihydrate)	12 µg
Budesonide	200 µg

The storage unit of the inhaler is filled with sufficient for 30 at least 200 doses.

23940-804 (D)

<u>Active ingredient</u>	<u>Per dose</u>
Formoterol (as fumarate dihydrate)	24 µg
Budesonide	200 µg

5 The storage unit is filled with sufficient for at least 200 doses.

<u>Active ingredient</u>	<u>Per dose</u>
Formoterol (as fumarate dihydrate)	12 µg
Budesonide	100 µg

10 The storage unit is filled with sufficient for at least 200 doses.

Example 2 - Metered dose inhaler

<u>Active ingredient</u>	<u>Per dose</u>
Formoterol (as fumarate dihydrate)	12 µg
15 Budesonide	200 µg
Stabilizer	0.1 - 0.7 mg
Propellant	25 - 100 µg

<u>Active ingredient</u>	<u>Per dose</u>
Formoterol (as fumarate dihydrate)	24 µg
20 Budesonide	200 µg
Stabilizer	0.1 - 0.7 mg
Propellant	25 - 100 µg

<u>Active ingredient</u>	<u>Per dose</u>
Formoterol (as fumarate dihydrate)	12 µg
25 Budesonide	100 µg
Stabilizer	0.1 - 0.7 mg
Propellant	25 - 100 µg

23940-804 (D)

Example 3 - Metered dose dry powder formulation

	<u>Active ingredient</u>	<u>Per dose</u>
	Formoterol (as fumarate dihydrate)	12 µg
5	Budesonide	200 µg
	Lactose	up to 5, 12.5 or 25 mg
	<u>Active ingredient</u>	<u>Per dose</u>
	Formoterol (as fumarate dihydrate)	24 µg
	Budesonide	200 µg
10	Lactose	up to 5, 12.5 or 25 mg
	<u>Active ingredient</u>	<u>Per dose</u>
	Formoterol (as fumarate dihydrate)	12 µg
	Budesonide	100 µg
	Lactose	up to 5, 12.5 or 25 mg

23940-804 (D)

10

CLAIMS:

1. Use of effective amounts of

(i) formoterol, or a physiological acceptable salt thereof, or a solvate of said salt, or a solvate of formoterol;
5 and

(ii) budesonide,

for manufacturing a medicament for treating nocturnal asthma, wherein components (i) and (ii) are to be used simultaneously to treat the nocturnal asthma.

10 2. A use according to claim 1, in which component (i) is formoterol fumarate dihydrate.

3. A use according to claim 1 or 2 in which the ratio of the component (i) to component (ii) is in a range of 1:4 to 1:70.

15 4. A use according to any one of claims 1 to 3, in which the medicament is to be used in a twice daily dose regime wherein component (i) is to be used in a dose of 6 - 100 µg per day and component (ii) is to be used in a dose of 50 - 4800 µg per day.

20 5. A use according to claim 4 in which the dose of component (i) is 6 - 48 µg per day and the dose of component (ii) is 100 to 1600 µg per day.

6. A system comprising

(i) formoterol, or a physiologically acceptable salt thereof, or a solvate of said salt, or a solvate of formoterol, and
25 (ii) budesonide,

23940-804 (D)

11

together in a dry powder inhaler for simultaneous administration by inhalation.

7. A system comprising

(i) formoterol, or a physiologically acceptable

5 salt thereof, or a solvate of said salt, or a solvate of formoterol, and

(ii) budesonide,

together in a Turbuhaler inhaler for simultaneous administration by inhalation.

10 8. The system of claim 6 or 7, wherein component (i) is formoterol fumarate dihydrate.
